

ADL v0.92 — Documentation Review Findings

Chat lane · independent, read-only, findings-first

Date	2026-08-24
Packet	THIRD_PARTY_REVIEW_HANDOFF_v0.92.md (WP-23 / #312)
Scope per handoff	Documentation review only — not code, not release approval
Verdict	BLOCKED
Findings	1 P1, 2 P2, 1 P3
Target revision	Not established — no dispatch, no head SHA, no corpus digest

Verdict

BLOCKED, on the packet's own Send Gate. The gate requires a dispatch naming the canonical PR, base branch, exact head SHA, and SHA-256 of the retained inventory, with the reviewer recomputing that digest. No dispatch was provided with this request, and this environment has no git access, so the head SHA cannot be confirmed and the corpus digest cannot be recomputed. Gate items 1 and 2 therefore fail, and the packet instructs that a review under these conditions is not a valid exact-revision review. This is a procedural result, not a judgement about documentation quality.

The milestone's own documents agree v0.92 is not closeable today: the quality gate states it is “a gate plan, not evidence that a gate has passed”, and the milestone checklist leaves the internal review, third-party send gate, findings resolution, and release ceremony boxes unchecked.

Method and honesty boundary

Read this pass: the v0.92 handoff; QUALITY_GATE_v0.92.md; MILESTONE_CHECKLIST_v0.92.md; the docs-release-truth-312 directory listing; workspace and adl/src directory sizes and file counts, measured identically to prior milestones.

Not done, therefore not asserted: no git operations (no SHA confirmation, no digest recomputation, no origin/main diff); none of the four read-only Ruby/git validation commands were executed; no build, no tests; no GitHub issue or PR state refresh; the full canonical inventory and every feature document were not individually read.

No 15-category scorecard is included. Four documents and two directory measurements were verified. Scoring fourteen further categories would be fabrication. Every statement below traces to something opened or measured.

Findings

F1 · V092-CHAT-01 — P1

title	Send Gate unsatisfied: no dispatch, no exact head SHA, no recomputed corpus digest
evidence	THIRD_PARTY_REVIEW_HANDOFF_v0.92.md, Send Gate items 1–2 and Target Revision table: <i>Pull request</i> = “Canonical #312 PR named in the dispatch”; <i>Exact head SHA</i> = “Canonical PR head named in the dispatch; must match checkout HEAD”; <i>Corpus digest</i> = SHA-256 of docs/reviews/v0.92/docs-release-truth-312/inventory.json “named in the dispatch and recomputed by the reviewer”. No dispatch accompanied this request.
impact	Findings cannot be bound to a revision. The stale-revision rule cannot operate, and the inventory-digest mechanism — the packet’s core integrity control — is bypassed rather than satisfied. No exact-revision documentation review has occurred.
fix	Issue the dispatch naming PR, base, exact head SHA, and inventory SHA-256; reviewer checks out that SHA, recomputes the digest, runs the four read-only commands, then reviews. Bounded: no code change.

F2 · V092-CHAT-02 — P2

title	Code-reduction claim is not supported by measurement at workspace level
evidence	adl/src measured 2026-08-24: 3.12 MB, 91 files, 19 subdirectories . Same path, measured identically: v0.91.7 = 3.18 MB / 96 files; v0.91.8 = 3.26 MB / 97 files. Net change across three milestones is roughly –2% from v0.91.7. Largest legacy files remain and several grew: long_lived_agent.rs 218 KB (was 209 KB), csm_runtime_api.rs 211 KB (was 198 KB), aws_remote_validation.rs 194 KB, resilience.rs 192 KB, scheduler.rs 162 KB. Workspace now also contains csdlc-v3 alongside csdlc-v2, plus adl-v2 (10 crates), adl-runtime, adl-runtime-kernel, adl-characterization, adl-resilience, adl-spec.
impact	“Reducing the project codebase considerably” is not measurable in tracked source. The dual-implementation state flagged at v0.91.7 and v0.91.8 has now become triple for the control plane (csdlc-v2 and csdlc-v3 coexisting with legacy). A fix landing in one implementation and not its siblings stays invisible until it manifests.
fix	Publish the measured before/after figure with the path and method used, or restate the claim as scoped to specific deleted surfaces. Then publish the per-subsystem boot-path table (which crate executes for chronosense, AEE, affect, reasoning graph, skills, curiosity) — still outstanding from v0.91.8 F3.

F3 · V092-CHAT-03 — P2

title	Request framing conflicts with the milestone’s own documented state
evidence	Request: “ready to close it after your review”. QUALITY_GATE_v0.92.md line 3: “It is a gate plan, not evidence that a gate has passed.” MILESTONE_CHECKLIST_v0.92.md: <i>Internal review completed, Third-party documentation review handoff passes its exact-revision send gate, Findings resolved or explicitly deferred, Release ceremony completed, Formatting, lint, and tests pass, and Every feature listed in features/README.md has landed exact-revision implementation, validation, review, and integration evidence</i> all remain unchecked.

impact	A reviewer who accepted the framing rather than reading the artifacts would report readiness the repository contradicts. The documents are the honest party here; the framing is not. This is the risk the packet's non-claims section exists to prevent.
fix	Align external framing with the checklist: v0.92 engineering is complete; documentation reconciliation, #467 gate hydration, external review, and ceremony are open. No document change required — the documents are already correct.

F4 · V092-CHAT-04 — P3

title	Quality gate carries an unreconciled result-status ambiguity
evidence	QUALITY_GATE_v0.92.md states a schema-valid packet “may truthfully report blocked” and that WP-23 “must preserve the blocked result”, while WP-22A Corrective Hydration records #467 as accepting 30 rows with “zero blockers” and downstream unlock true. The handoff instructs reviewers to verify #467 against exact canonical proof rather than infer it.
impact	Two adjacent passages in one gate document imply different entering results (blocked vs. zero-blocker unlock). A downstream reader could cite either. Low severity because the handoff already flags it, but the ambiguity sits in the gate itself.
fix	State the single canonical entering result in one place with its owning issue, and mark the other passage as historical provenance — as already done for #311/PR #466.

Verified non-findings

Packet construction is sound

The Send Gate, stale-revision rule, corpus-digest requirement, reviewer-authority limits, excluded scope, non-claims list, and PASS/CHANGES_REQUESTED/BLOCKED vocabulary are well built. They are the reason this review reaches a defensible BLOCKED rather than an inferred verdict. The packet did its job.

Retained inventory exists at the expected path

docs/reviews/v0.92/docs-release-truth-312/ contains inventory.json, review-packet.md, and release-truth-diff.md, matching the handoff's Review Order references. Existence verified; digest not recomputed (see F1).

Quality gate refuses to award credit to synthetic evidence

Global Rules exclude scaffolding, placeholders, fixtures, demo mode, synthetic success, and provider substitution from completion credit, and the production-birthday composition gate explicitly blocks library-only, fixture-only, metadata-only, and documentation-only dispositions. This directly addresses the self-validating-metric class of finding raised at v0.91.8.

Non-claims are explicit and correctly scoped

The handoff and checklist both disclaim completed birthday, legal personhood, production citizenship, consciousness, governance completion, release readiness, and deployment readiness. The checklist separately distinguishes birthday, startup, wake, snapshot, admission, and copied state — a meaningful distinction to hold.

Limitations

No git access: head SHA unconfirmed, corpus digest not recomputed, origin/main diff not run. None of the four read-only validation commands executed. The full canonical inventory and individual feature documents were not read; F2's measurement is directory-level, not a line-count diff. Findings describe the working tree as read on 2026-08-24 and must be re-verified against the eventual frozen revision.

Recommended close path

1. Issue the dispatch with PR, base, exact head SHA, and inventory SHA-256 (F1).
2. Run the four read-only validation commands at that SHA and retain their output.
3. Reconcile the entering quality-gate result to a single canonical statement (F4).
4. Publish the measured code-reduction figure and the per-subsystem boot-path table (F2).
5. Then dispatch the exact-revision documentation review; findings route to WP-27 remediation.
